Process Control
Distribution Control System (DCS)

FENTON SYSTEMS INC.

This system controls three boilers and the balance of plant feed water processing. The system is based on a Bailey INFI 90 distributed control system (DCS). The system consists of two redundant server workstations and two client workstations, plus an engineering workstation. The workstations provide the operator interface to the system.

From any workstation, process loops can be managed and system status can be viewed. The balance of plant graphic screen is shown on the right and a typical boiler screen is shown below.

The system configuration is shown on the drawing below.
